**Abstract**

This is the first generation of the model. It's a draft. Who would even care to read the abstract when it's not done anyways?

*Keywords:* None 1, None 2, None 3

## Rewrite note

This proof will be organized using the following guideline

1. reviewing existing definitions and theorem
  2. proving certain property of the existing mathematical objects
  3. defining the conditions of the model
  4. formulating of the model
  5. parameterize the model
  6. asserting defined property of the model

It turned out that figures will crash overleaf, if you want to view such file, please compile them seperately. To merge the file, it is needed to either pay the subscription or download and run it on your computer.

Tensor

$$(1) \quad (A+B)^{i_1 \dots i_n}_{\phantom{i_1 \dots i_n} j_1 \dots j_m} = A^{i_1 \dots i_n}_{\phantom{i_1 \dots i_n} j_1 \dots j_m} + B^{i_1 \dots i_n}_{\phantom{i_1 \dots i_n} j_1 \dots j_m}$$

$$(2) \quad (\alpha A)^{i_1 \dots i_n}_{j_1 \dots j_m} = \alpha A^{i_1 \dots i_n}_{j_1 \dots j_m}$$

$$(3) \quad (A \otimes B)^{i_1 \dots i_l i_{l+1} \dots i_{l+n}}{}_{j_1 \dots j_k j_{k+1} \dots j_{k+m}} = A^{i_1 \dots i_l}{}_{j_1 \dots j_k} B^{i_{l+1} \dots i_{l+n}}{}_{j_{k+1} \dots j_{k+m}}$$

$$(4) \quad (\text{contr } T)^{i_1 \dots i_n}_{j_1 \dots j_m} = \sum_a T^{i_1 \dots i_n a}_{aj_1 \dots j_m}$$

$$(5) \quad (AB)_j^i = \text{contr}(A \otimes B) = \sum_k A_k^i B_j^k$$

$$(6) \quad \begin{pmatrix} \begin{bmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{bmatrix} \begin{bmatrix} B_{11} & B_{12} \\ B_{21} & B_{22} \end{bmatrix} \end{pmatrix}_{ij} = \sum_k A_{ik} B_{kj}$$

$$(7) \quad IA = A = AI$$

$$(8) \quad I_n = \text{diag} (1, 1, \dots, 1)$$

$$(9) \quad I_{a+b} = \begin{bmatrix} I_a & 0_{a \times b} \\ 0_{b \times a} & I_b \end{bmatrix}$$

$$(10) \quad T_{a,b}T_{a,b} = I$$

## Group

**Definition 1** (Lie group (Lee, 2013, Chapter 7)). A *Lie group* is a smooth manifold  $G$  (without boundary) that is also a group in the algebraic sense, with the property that the multiplication map  $m : G \times G \rightarrow G$  and the inversion map  $i : G \rightarrow G$ , given by

$$m(g, h) = gh, \quad i(g) = g^{-1}$$

are both smooth.

**Preposition 1** (Lie group (Lee, 2013, Chapter 7)). *If  $G$  is a smooth manifold with a group structure such that the map  $G \times G \rightarrow G$  given by  $(g, h) \mapsto gh^{-1}$  is smooth, then  $G$  is a Lie group.*

**Definition 2** (Semidirect product). Suppose  $H$  and  $N$  are groups, and  $\theta : H \times N \rightarrow N$  is a smooth left action of  $H$  on  $N$ . It is said to be an *action by automorphisms* if for each  $h \in H$ , the map  $\theta_h : N \rightarrow N$  is a group automorphism of  $N$  (i.e., an isomorphism from  $N$  to itself). Given such action, we define a new group  $N \rtimes_\theta H$ , called a *semidirect product* of  $H$  and  $N$ , as follows.  $N \rtimes_\theta H$  is just the Cartesian product  $N \times H$ ; but the group multiplication is defined by

$$(n, h)(n', h') = (n\theta_h(n'), hh').$$

**Definition 3.** A *Klein geometry* is a pair  $(G, H)$  where  $G$  is a Lie group and  $H$  is a closed Lie subgroup of  $G$  such that the (left) coset space

$$X := G/H$$

is connected.

**Example 3.1.** KleinGeometryExamples (I)

## Manifold

**Definition 4** (Abstract differentiable manifold (Wolfgang, 2006, Chapter 5A)). A *k-dimensional differentiable manifold* (briefly: a *k-manifold*) is a set  $M$  together with a family  $(M_i)_{i \in I}$  of subsets such that

1.  $M = \bigcup_{i \in I} M_i$  (union),
2. for every  $i \in I$  there is an injective map  $\varphi_i : M_i \rightarrow \mathbb{R}^k$  so that  $\varphi_i(M_i)$  is open in  $\mathbb{R}^k$ , and
3. for  $M_i \cap M_j \neq \emptyset$ ,  $\varphi_i(M_i \cap M_j)$  is open in  $\mathbb{R}^k$ .

**Definition 5** (Structures on a manifold (Wolfgang, 2006, Chapter 5A)). Given a *k*-dimensional differentiable manifold, one gets additional structure by replacing additional requirements on the transformation functions  $\varphi_j \circ \varphi_i^{-1}$ , which belong to the atlas of the manifold; if all  $\varphi_j \circ \varphi_i^{-1}$  are (left-hand side), then one speaks of (right-hand side) as follows:

continuous	$\leftrightarrow$	topological manifold
differentiable	$\leftrightarrow$	differentiable manifold
$C^1$ -differentiable	$\leftrightarrow$	$C^1$ -manifold
$C^r$ -differentiable	$\leftrightarrow$	$C^r$ -manifold
$C^\infty$ -differentiable	$\leftrightarrow$	$C^\infty$ -manifold
real analytic	$\leftrightarrow$	real analytic manifold
complex analytic	$\leftrightarrow$	complex analytic manifold of dimension $\frac{k}{2}$
affine	$\leftrightarrow$	affine manifold
projective	$\leftrightarrow$	projective manifold
conformal	$\leftrightarrow$	manifold with a conformal structure
orientation-preserving	$\leftrightarrow$	orientable manifold

**Definition 6** (Tangent vector (Wolfgang, 2006, Chapter 5B)). A *tangent vector*  $X$  at  $p$  is a derivation (derivative operator) defined on the set of *germs of functions*

$$\mathcal{F}_p(M) := \{ f : M \rightarrow \mathbb{R} \mid f \text{ differentiable} \} / \sim ,$$

where the equivalence relation  $\sim$  is defined by declaring  $f \sim f^*$  if and only if  $f$  and  $f^*$  coincide in a neighborhood of  $p$ . The value  $X(f)$  is also referred to as the *directional derivative* of  $f$  in the direction  $X$ .

This definition means more precisely the following.  $X$  is a map  $X : \mathcal{F}_p(M) \rightarrow \mathbb{R}$  with the two following properties:

1.  $X(\alpha f + \beta g) = \alpha X(f) + \beta(g)$ ,  $f, g \in \mathcal{F}_p(M)$  ( $\mathbb{R}$ -linearity);
2.  $X(f \cdot g) = X(f) \cdot g(p) + f(p) \cdot X(g)$  for  $f, g \in \mathcal{F}_p(M)$  (product rule).

(For this to make sense, both  $f$  and  $g$  have to be defined in a neighborhood of  $p$ .)

Briefly: *tangent vectors are derivations acting on scalar functions.*

**Definition 7** (Tangent space (Wolfgang, 2006, Chapter 5B)). The *tangent space*  $T_p M$  of  $M$  at  $p$  is defined in all cases as the set of all tangent vectors at the point  $p$ . By definition  $T_p M$  and  $T_q M$  are disjoint if  $p \neq q$ .

**Definition 8** (Derivative (Wolfgang, 2006, Chapter 5B)). Let  $F : M \rightarrow N$  be a differentiable map, and let  $p, q$  be two fixed points with  $F(p) = q$ . Then the *derivative* or the *differential* of  $F$  at  $p$  is defined as the map

$$DF|_p : T_p M \rightarrow T_q N$$

whose value at  $X \in T_p M$  is given by  $(DF|_p(X))(f) = X(f \circ F)$  for every  $f \in \mathcal{F}_q(N)$  (which automatically implies the relation  $f \circ F \in \mathcal{F}_p(M)$ ).

**Lemma 1** (Chain rule (Wolfgang, 2006, Chapter 5B)). *For the derivative as defined in this manner, one has the chain rule in the form*

$$D(G \circ F)|_p = DG|_{F(p)} \circ DF|_p$$

for every composition  $M \xrightarrow{F} N \xrightarrow{G} Q$  of maps, or, more briefly,  $D(G \circ F) = DG \circ DF$ .

**Definition 9** (Riemannian metric (Wolfgang, 2006, Chapter 5C)). A *Riemannian metric*  $g$  on  $M$  is an association  $p \mapsto g_p \in L^2(T_p M; \mathbb{R})$  such that the following conditions are satisfied:

1.  $g_p(X, Y) = g_p(Y, X)$  for all  $X, Y$ , (symmetry)

2.  $g_p(X, X) > 0$  for all  $X \neq 0$ , *(positive definiteness)*

3. The coefficient  $g_{ij}$  in every local representation (i.e., in every chart)

$$g_p = \sum_{i,j} g_{ij}(p) \cdot dx^i|_p \otimes dx^j|_p$$

are differentiable functions.

*(differentiability)*

*Remark 1.* The pair  $(M, g)$  is then called *Riemannian manifold*. One also refers to the Riemannian metric as the *metric tensor*. In local coordinates the metric tensor is given by the matrix  $(g_{ij})$  of functions. In Ricci calculus this is simply written as  $g_{ij}$ .  
(Wolfgang, 2006, Chapter 5C)

*Remark 2.* A Riemannian metric  $g$  defines at every point  $p$  an *inner product*  $g_p$  on the tangent space  $T_p M$ , and therefore the notation  $\langle X, Y \rangle$  instead of  $g_p(X, Y)$  is also used. The notions of angles and lengths are determined by this inner product, just as these notions are determined by the first fundamental form on surface elements. The length or norm of vector  $X$  is given by  $\|X\| := \sqrt{g(X, X)}$ , and the angle  $\beta$  between two tangent vectors  $X$  and  $Y$  can be defined by the validity of the equation  $\cos \beta \cdot \|X\| \cdot \|Y\| = g(X, Y)$ . (Wolfgang, 2006, Chapter 5C)

**Curvature**

**Example 9.1.**

$$S(v) = \pm \nabla_v n$$

**Example 9.2.** Eigenvalue of second fundamental form (or shape operator)

**Objective**

**Objective.** The objective is that given a natural number  $n$  and a real number  $\kappa$ , one can construct

1. a set  $M$
2. a Lie group  $M$  with operation  $\otimes_M$ ,
3. an  $n$ -dimensional  $C^\infty$ -manifold  $M$  with chart  $\varphi_i \subset M \rightarrow \mathbb{R}^n$ ,
4. a Riemannian manifold  $M$  with inner product  $g_p \in T_p M \times T_p M \rightarrow \mathbb{R}$

(to be determined) such that

- group action is distance preserved.
- model is continuous with respect to  $\kappa$  (and smooth with respect to each basis).
- for all two-dimensional linear subspaces of the manifold, the sectional curvature is  $\kappa$ .

(cannot figure formal definition out yet.)

**Conjecture 1.** If the parameters  $(\kappa, n)$  is associated with Klein geometry  $(G, H)$  then  $(M, \otimes_M) \cong G/H$ .

That is, from example 3.1,

- For  $\kappa > 0$ ,  $G \cong O(n+1)$  and  $H \cong O(n)$ .
- For  $\kappa = 0$ ,  $G \cong \text{Euc}(n)$  and  $H \cong O(n)$ .
- For  $\kappa < 0$ ,  $G \cong O^+(1, n)$  and  $H \cong O(n)$ .

### Model Foundation

Construction of the set  $M$  and operator  $\otimes_M$ ...

### Trigonometry

**Definition 10.** Generalized trigonometric functions  $f_k : \mathbb{R} \rightarrow \mathbb{R}$  and  $f_k^* : \mathbb{R} \rightarrow \mathbb{R}$  are defined as

$$\begin{aligned} f_k(\theta) &:= \begin{cases} g(k\theta) & \text{if } k \geq 0, \\ h(k\theta) & \text{otherwise,} \end{cases} \\ f_k^*(\theta) &:= \begin{cases} g(k\theta) & \text{if } k \geq 0, \\ h(-k\theta) & \text{otherwise,} \end{cases} \\ &= \begin{cases} g(k\theta) & \text{if } k \geq 0, \\ \pm h(k\theta) & \text{otherwise,} \end{cases} \end{aligned}$$

where  $g$  (resp.  $h$ ) are the associated trigonometric (resp. hyperbolic) function.

**Corollary 1** (Absolute value of generalized trigonometric functions).

$$\text{abs } f_k(\theta) = \text{abs } f_k^*(\theta)$$

**Example 10.1** (Generalized sine functions).

$$\begin{aligned}\sin_k \theta &:= \begin{cases} \sin(k\theta) & \text{if } k \geq 0, \\ \sinh(k\theta) & \text{otherwise.} \end{cases} \\ \sin_k^* \theta &:= \begin{cases} \sin(k\theta) & \text{if } k \geq 0, \\ \sinh(-k\theta) & \text{otherwise.} \end{cases} \\ &= \begin{cases} \sin(k\theta) & \text{if } k \geq 0, \\ -\sinh(k\theta) & \text{otherwise.} \end{cases}\end{aligned}$$

(see Figure 2)

**Example 10.2** (Generalized cosine functions).

$$\begin{aligned}\cos_k \theta &:= \begin{cases} \cos(k\theta) & \text{if } k \geq 0, \\ \cosh(k\theta) & \text{otherwise.} \end{cases} \\ \cos_k^* \theta &:= \begin{cases} \cos(k\theta) & \text{if } k \geq 0, \\ \cosh(k\theta) & \text{otherwise.} \end{cases} \\ &= \cos_k \theta\end{aligned}$$

(see Figure 3)

**Example 10.3** (Generalized tangent functions).

$$\begin{aligned}\tan_k \theta &:= \begin{cases} \tan(k\theta) & \text{if } k \geq 0, \\ \tanh(k\theta) & \text{otherwise.} \end{cases} \\ \tan_k^* \theta &:= \begin{cases} \tan(k\theta) & \text{if } k \geq 0, \\ \tanh(-k\theta) & \text{otherwise.} \end{cases} \\ &= \begin{cases} \tan(k\theta) & \text{if } k \geq 0, \\ -\tanh(k\theta) & \text{otherwise.} \end{cases}\end{aligned}$$

(see Figure 4)

**Theorem 1** (Pythagorean's identity equivalence).

$$\begin{aligned}\cos_k^2 \theta + \operatorname{sgn} k \sin_k^2 \theta &= 1 \\ 1 + \operatorname{sgn} k \tan_k^2 \theta &= \sec_k^2 \theta \\ \cot_k^2 \theta + \operatorname{sgn} k &= \csc_k^2 \theta\end{aligned}$$

*Proof of theorem 1.* Proof by exhaustion. □

**Preposition 2** (Generalized trigonometric functions of sum of arguments).

$$\begin{aligned}\sin_k(\theta + \phi) &= \sin_k \theta \cos_k \phi + \cos_k \theta \sin_k \phi \\ \sin_k^*(\theta + \phi) &= \sin_k^* \theta \cos_k \phi + \cos_k \theta \sin_k^* \phi \\ \cos_k(\theta + \phi) &= \cos_k \theta \cos_k \phi - \operatorname{sgn} k \sin_k \theta \sin_k \phi \\ &= \cos_k \theta \cos_k \phi - \sin_k^* \theta \sin_k \phi \\ &= \cos_k \theta \cos_k \phi - \sin_k \theta \sin_k^* \phi\end{aligned}$$

*Proof of proposition 2.* Proof by exhaustion. □

Matrices

**Definition 11.** *Generalized rotation matrix* is defined as

$$R_k(\theta) := \begin{bmatrix} \cos_k \theta & -\sin_k^* \theta \\ \sin_k \theta & \cos_k \theta \end{bmatrix},$$

where  $\theta \in \mathbb{R}$ .

**Corollary 2** (Generalized rotation matrix at zero).

$$R_k(0) = I_2$$

*Proof of corollary 2.* Obvious □

**Corollary 3** (Generalized rotation matrix of sum of arguments).

$$R_k(\theta) R_k(\phi) = R_k(\theta + \phi)$$

*Proof of corollary 3.*

$$\begin{aligned}
 R_k(\theta) R_k(\phi) &= \begin{bmatrix} \cos_k \theta & -\sin_k^* \theta \\ \sin_k \theta & \cos_k \theta \end{bmatrix} \begin{bmatrix} \cos_k \phi & -\sin_k^* \phi \\ \sin_k \phi & \cos_k \phi \end{bmatrix} && \text{(definition 11)} \\
 &= \begin{bmatrix} \cos_k \theta \cos_k \phi + (-\sin_k^* \theta) \sin_k \phi & \cos_k \theta (-\sin_k^* \phi) + (-\sin_k^* \theta) \cos_k \phi \\ \sin_k \theta \cos_k \phi + \cos_k \theta \sin_k \phi & \sin_k \theta (-\sin_k^* \phi) + \cos_k \theta \cos_k \phi \end{bmatrix} && \text{(Equation (5))} \\
 &= \begin{bmatrix} \cos_k \theta \cos_k \phi - \sin_k^* \theta \sin_k \phi & -(\sin_k^* \theta \cos_k \phi + \cos_k \theta \sin_k^* \phi) \\ \sin_k \theta \cos_k \phi + \cos_k \theta \sin_k \phi & \cos_k \theta \cos_k \phi - \sin_k \theta \sin_k^* \phi \end{bmatrix} && \text{(simplify)} \\
 &= \begin{bmatrix} \cos_k \theta + \phi & -\sin_k^* \theta + \phi \\ \sin_k \theta + \phi & \cos_k \theta + \phi \end{bmatrix} && \text{(proposition 2)} \\
 &= R_k(\theta + \phi) && \text{(definition 11)}
 \end{aligned}$$

**Corollary 4** (Inverse of generalized rotation matrix).

*Proof of corollary 4.*

$$R_k(\theta)^{-1} = R_k(-\theta)$$

(corollary 3)

(corollary 2)

□

**Definition 12.** *Position matrix* is defined recursively as

$$\begin{aligned}
 P_{k,n}(\{\theta^1, \dots, \theta^n\}) &:= \begin{bmatrix} P_{k,n-1}(\{\theta^1, \dots, \theta^{n-1}\}) & 0_{n \times 1} \\ 0_{1 \times n} & 1 \end{bmatrix} T_{2,n+1} \begin{bmatrix} R_k(\theta^n) & 0_{2 \times n-1} \\ 0_{n-1 \times 2} & I_{n-1} \end{bmatrix} T_{2,n+1}, \\
 P_{k,0} &:= I_1,
 \end{aligned}$$

where  $\theta = \{\theta^i\} \in \mathbb{R}^n$  for  $i \in \{1..n\}$ .

**Definition 13.** Let  $P(n, k)$  be set of position matrices.

**Corollary 5** (Position matrix at zero).

$$P_{k,n}(0_n) = I_{n+1}$$

*Proof of corollary 5.* Prove by mathematical induction on  $n$ , Let

$$(11) \quad P_{k,n-1}(0_{n-1}) = I_n$$

$$\begin{aligned}
 P_{k,n}(0_n) &= \begin{bmatrix} P_{k,n-1}(0_{n-1}) & 0_{n \times 1} \\ 0_{1 \times n} & 1 \end{bmatrix} T_{2,n+1} \begin{bmatrix} R_k(0) & 0_{2 \times n-1} \\ 0_{n-1 \times 2} & I_{n-1} \end{bmatrix} T_{2,n+1} \quad (\text{definition 12}) \\
 &= \begin{bmatrix} I_n & 0_{n \times 1} \\ 0_{1 \times n} & 1 \end{bmatrix} T_{2,n+1} \begin{bmatrix} R_k(0) & 0_{2 \times n-1} \\ 0_{n-1 \times 2} & I_{n-1} \end{bmatrix} T_{2,n+1} \quad (\text{Equation (11)}) \\
 &= \begin{bmatrix} I_n & 0_{n \times 1} \\ 0_{1 \times n} & 1 \end{bmatrix} T_{2,n+1} \begin{bmatrix} I_2 & 0_{2 \times n-1} \\ 0_{n-1 \times 2} & I_{n-1} \end{bmatrix} T_{2,n+1} \quad (\text{corollary 2}) \\
 &= I_{n+1} T_{2,n+1} I_{n+1} T_{2,n+1} \quad (\text{Equation (9)}) \\
 &= T_{2,n+1} T_{2,n+1} \quad (\text{Equation (7)}) \\
 &= I_{n+1} \quad (\text{Equation (10)})
 \end{aligned}$$

□

**Definition 14.** Orientation matrix is defined as

$$Q_n^\pm(\phi_{n-1}, \phi_{n-2}, \dots, \phi_1) := \begin{bmatrix} 1 & 0_{1 \times n} \\ 0_{n \times 1} & X_{+1,n-1}^\pm(\phi_{n-1}, \phi_{n-2}, \dots, \phi_1) \end{bmatrix}, \\
 Q_0^\pm := \pm I_1,$$

where  $\phi_m \in \mathbb{R}^m$  for  $m \in \{1..n-1\}$ .

**Definition 15.** Let  $Q(n)$  be set of orientation matrices.

**Corollary 6** (Orientation matrix at zero).

$$Q_n^+(0_{n-1}, 0_{n-2}, \dots) = I_{n+1}$$

*Proof of corollary 6.* Prove by mathematical induction on  $n$ , Let

$$(12) \quad Q_{n-1}^+(0_{n-2}, 0_{n-3}, \dots) = I_n$$

$$Q_n^+(0_{n-1}, 0_{n-2}, \dots) = \begin{bmatrix} 1 & 0_{1 \times n} \\ 0_{n \times 1} & X_{+1,n-1}^\pm(0_{n-1}, 0_{n-2}, \dots) \end{bmatrix} \quad (\text{definition 14})$$

$$\begin{aligned}
&= \begin{bmatrix} 1 & 0_{1 \times n} \\ 0_{n \times 1} & P_{+1,n-1}(0_{n-1}) Q_{n-1}^+(0_{n-2}, 0_{n-3}, \dots) \end{bmatrix} && (\text{definition 16}) \\
&= \begin{bmatrix} 1 & 0_{1 \times n} \\ 0_{n \times 1} & P_{+1,n-1}(0_{n-1}) I_n \end{bmatrix} && (\text{Equation (12)}) \\
&= \begin{bmatrix} 1 & 0_{1 \times n} \\ 0_{n \times 1} & P_{+1,n-1}(0_{n-1}) \end{bmatrix} && (\text{Equation (7)}) \\
&= \begin{bmatrix} 1 & 0_{1 \times n} \\ 0_{n \times 1} & I_n \end{bmatrix} && (\text{corollary 5}) \\
&= I_{n+1} && (\text{Equation (9)})
\end{aligned}$$

$$Q_n^+(0_{n-1}, 0_{n-2}, \dots) = I_{n+1}$$

□

**Definition 16.** Point matrix is defined as

$$X_{k,n}^\pm(\theta, \phi_{n-1}, \phi_{n-2}, \dots, \phi_1) := P_{k,n}(\theta) Q_n^\pm(\phi_{n-1}, \phi_{n-2}, \dots, \phi_1),$$

where  $\theta \in \mathbb{R}^n$  and  $\phi_m \in \mathbb{R}^m$  for  $m \in \{1..n-1\}$ .

**Definition 17.** Let  $X(n, k)$  be set of point matrices.

**Corollary 7** (Position matrix as subset of point matrix).

$$P(k, n) \subset X(k, n)$$

*Proof of corollary 7.*

$$\forall P \in P(k, n) \forall Q \in Q(n), PQ \in X(k, n) \quad (\text{definition 16})$$

$$\implies PI \in X(k, n) \quad (\text{corollary 6})$$

$$\implies P \in X(k, n) \quad (\text{Equation (7)})$$

$$P(k, n) \subset X(k, n)$$

□

**Corollary 8** (Point matrix at zero).

$$X_{k,n}^+(0_n, 0_{n-1}, \dots) = I_{n+1}$$

*Proof of corollary 8.* It can be implied from corollaries 5 and 6. □

## Group structure

Proof of validity of  $\mathbb{G}_M$  and  $\mathbb{H}_M$  (validity of  $\otimes_{\mathbb{M}}$ , proof of the matrices to be  $\mathbb{H}_M$  will later be discussed)...

**Lemma 2.** *Orientation matrix with multiplication is isomorphic to orthogonal group.*

*Proof of lemma 2.* Let

- the group of  $Q(n)$  with multiplication is  $(Q(n), \cdot)$ ,
- the group of  $X(+1, n)$  with multiplication is  $(X(+1, n), \cdot)$ ,
- the group of  $P(+1, n)$  with multiplication is  $(P(+1, n), \cdot)$ .

Consider the mapping

$$f : X_{+1, n-1}^{\pm}(\phi, \dots) \mapsto Q_n^{\pm}(\phi, \dots) \in X(1, n-1) \rightarrow Q(n),$$

$$f^{-1} : Q_n^{\pm}(\phi, \dots) \mapsto X_{+1, n-1}^{\pm}(\phi, \dots) \in Q(n) \rightarrow X(1, n-1),$$

which by definition 14 is equivalent to

$$(13) \quad f : X \mapsto \begin{bmatrix} 1 & 0 \\ 0 & X \end{bmatrix}.$$

For any point matrices  $X_1, X_2 \in X(1, n-1)$ , it can be shown that

$$\begin{aligned} f(X_1) \cdot f(X_2) &= \begin{bmatrix} 1 & 0 \\ 0 & X_1 \end{bmatrix} \cdot \begin{bmatrix} 1 & 0 \\ 0 & X_2 \end{bmatrix} && \text{(Equation (13))} \\ &= \begin{bmatrix} 1 & 0 \\ 0 & X_1 \cdot X_2 \end{bmatrix} && \text{(Equation (6))} \end{aligned}$$

$$f(X_1) \cdot f(X_2) = f(X_1 \cdot X_2).$$

Therefore,

$$\forall n \in \mathbb{N}, Q(n) \cong X(+1, n-1)$$

$$\implies Q(n) \cong O(n) \iff X(+1, n-1) \cong O(n)$$

$$X(+1, n-1) \subset O(n) \implies \forall X \in X(+1, n-1), X \in O(n) \quad ()$$

$$\begin{aligned}
& \implies \forall X \in X(+1, n-1), X^{-1} = X^T & () \\
& \implies \forall Q \in Q(n) \exists X \in X(+1, n-1), \\
& Q^{-1} = \begin{bmatrix} 1 & 0 \\ 0 & X \end{bmatrix}^{-1} \\
& = \begin{bmatrix} 1 & 0 \\ 0 & X^{-1} \end{bmatrix} \\
& = \begin{bmatrix} 1 & 0 \\ 0 & X^T \end{bmatrix} \\
& = \begin{bmatrix} 1 & 0 \\ 0 & X \end{bmatrix}^T \\
& \implies \forall Q \in Q(n), Q^{-1} = Q^T \\
& \implies \forall Q \in Q(n), Q \in O(n+1) \\
& \implies Q(n) \subset O(n+1) \\
(14) \quad & X(+1, n-1) \subset O(n) \implies Q(n) \subset O(n+1) \\
& T_{i,j}^{-1} = T_{i,j} = T_{i,j}^T \implies T_{i,j} \in O \\
& R_1(\theta)^{-1} = R_1(\theta)^T \implies R_1(\theta) \in O(2) \\
& \implies \begin{bmatrix} R_1(\theta) & 0_{2 \times n-1} \\ 0_{n-1 \times 2} & I_{n-1} \end{bmatrix} \in O(n+1)
\end{aligned}$$

Prove by mathematical induction on  $n$ ,

$$\begin{aligned}
P(+1, n-1) \subset O(n) & \implies \forall P \in P(+1, n-1), P \in O(n) \\
& \implies \forall P \in P(+1, n-1), \begin{bmatrix} P & 0_{n \times 1} \\ 0_{1 \times n} & 1 \end{bmatrix} \in O(n+1) \\
& \implies \begin{bmatrix} P_{1,n-1} & 0_{n \times 1} \\ 0_{1 \times n} & 1 \end{bmatrix} T_{2,n+1} \begin{bmatrix} R_1 & 0_{2 \times n-1} \\ 0_{n-1 \times 2} & I_{n-1} \end{bmatrix} T_{2,n+1} \in O(n+1)
\end{aligned}$$

$$\implies \forall P \in P(+1, n), P \in O(n+1)$$

$$\implies P(+1, n) \subset O(n+1)$$

$$(15) \quad P(+1, n) \subset O(n+1)$$

Prove by mathematical induction on  $n$ ,

$$(16) \quad X(+1, n-1) \subset O(n)$$

$$\forall X \in X(1, n) \exists P \in P(1, n) \exists Q \in Q(n), X = P \cdot Q \quad (\text{definition 16})$$

$$\implies \exists P \in P(1, n) \exists Q \in O(n+1), X = P \cdot Q \quad ()$$

$$\implies \exists P \in O(n+1) \exists Q \in O(n), X = P \cdot Q \quad ()$$

$$\implies X \in O(n+1) \quad ()$$

$$(17) \quad X(1, n) \subset O(n+1)$$

(To be prove)

$$O(1, n-1) \subset X(1, n-1)$$

$$X(1, n-1) = O(n)$$

$$X(1, n-1) \cong O(n)$$

$$Q(n) \cong O(n)$$

$$Q(n) \cong O(n)$$

□

**Lemma 3.** *Point matrix with multiplication is isomorphic to principal group of the associated Klein geometry.*

*Proof of lemma 3.* The proof is left as an exercise to the other author.

Spherical case is proved successfully with lemma 2.

Euclidean case should use limits and first degree taylor series.

Hyperbolic case use lemma 2 and closed property.

□

**Lemma 4.** *Position matrix is isomorphic to quotient group of the associated Klein geometry.*

*Proof of lemma 4.* The proof is left as an exercise to the other author.

It can be seen that  $P \cong X/Q \iff X \cong P \ltimes Q$ , point matrix is isomorphic to the principal group, orientation matrix is isomorphic to the subgroup, and point matrix is product of position and orientation matrix.

They may be useful for proving that is not yet to be known.

Another way is to seek for general form of the matrix element of the group of the Klein geometry. □

### Model Parametrization

Construction of the charts  $\varphi\dots$

**Definition 18.** For point matrix  $X_{k,n}^\pm(\theta, \phi_1, \phi_2, \dots, \phi_n)$ ,  $n$ -dimensional vector  $\theta$  is defined as *position parameter*.

**Definition 19.** For point matrix  $X$ ,  $(n+1)$ -dimensional column vector  $p := \frac{1}{k}X \cdot e^1 = \frac{1}{k}X_1$  is defined as *position vector*.

**Definition 20.**  $P^*(k, n)$  is a set of position vectors.

**Lemma 5.** *For point matrix  $X = PO$  where  $P$  and  $O$  are position and orientation matrix respectively,  $p = \frac{1}{k}X_1 = \frac{1}{k}P_1$ .*

*Proof of lemma 5.* From definition 14, it is obvious that

$$(18) \quad O_1^i = \begin{cases} 1 & \text{if } i = 1, \\ 0 & \text{otherwise.} \end{cases}$$

$$\begin{aligned} p^i &= \frac{1}{k}X_1^i && \text{From definition 19} \\ &= \frac{1}{k} \sum_j P_j^i O_1^j && \text{From Equation (5)} \\ &= \frac{1}{k}P_1^i && \text{From Equation (18)} \end{aligned}$$

$$\begin{aligned} p &= \frac{1}{k} X_1 \\ &= \frac{1}{k} P_1 \end{aligned}$$

□

**Lemma 6.** Given position parameter  $\theta$ , position vector can be evaluated as the following.

$$\psi_0^{-1} : \theta \mapsto p = \frac{1}{k} \begin{pmatrix} \prod_{j \in \{1..n\}} \cos_k \theta^j \\ \sin_k \theta^{i-1} \prod_{j \in \{i..n\}} \cos_k \theta^j \\ \sin_k \theta^n \end{pmatrix}.$$

*Proof of lemma 6.* The proof is left as an exercise to the other author.

Use lemma 5 then  $p = \frac{1}{k} P \cdot e^1$  and recursively compute the vector.

□

**Lemma 7.** Given position vector  $p$ , position parameter can be calculated as the following.

$$\begin{aligned} \psi_0 : p \mapsto \theta &= \begin{pmatrix} \arcsin_k^{\operatorname{sgn} p^1} \frac{kp^2}{\prod_{j \in \{2..n\}} \cos_k \theta^j} \\ \arcsin_k \frac{kp^{i+1}}{\prod_{j \in \{i+1..n\}} \cos_k \theta^j} \\ \arcsin_k kp^{n+1} \end{pmatrix} \\ &\in \begin{cases} P \rightarrow \left(-\frac{\pi}{k}, \frac{\pi}{k}\right] \times \left[-\frac{1}{2}\frac{\pi}{k}, \frac{1}{2}\frac{\pi}{k}\right]^{n-1} & \text{if } k > 0 \\ P \rightarrow \mathbb{R}^n & \text{if } k \leq 0 \end{cases} \end{aligned}$$

where  $\cos_k (\arcsin_k^\pm(x)) = \pm \cos_k (\arcsin_k(x))$ .

*Proof of lemma 7.* The proof is left as an exercise to the other author.

Use ?? to compute the inverse mapping.

□

Proof of validity of  $\varphi$ ...

**Lemma 8.**

$$\Psi = \{ \psi \mid \psi^{-1} \in \left(-\frac{1}{2}\frac{\pi}{k}, +\frac{1}{2}\frac{\pi}{k}\right)^n \rightarrow R : \theta \mapsto P_{k,n}(\theta + x) \text{ for } x \in \mathbb{R}^n \}$$

is a coordinate chart of a  $C^\infty$  differential structure on  $R$

*Proof of lemma 8.* It is sufficient to shows that

1.  $R_\psi$  is an open subset of real vector space (defined),
2.  $\bigcup_{\psi \in \Psi} D_\psi = R$  (obvious or not),
3. transition map is in differentiability class  $C^\infty$ .

To show that  $\bigcup_{\psi \in \Psi} D_\psi = R$ .

The proof is left as an exercise to the other author.

Choose  $x$  as any then done.

To show that every transition map is in differentiability class  $C^\infty$ .

Consider  $\psi_1, \psi_2 \in \Psi$  and  $x_1, x_2 \in \mathbb{R}^n$  where

$$\psi_i^{-1} \in \left( -\frac{1}{2} \frac{\pi}{k}, +\frac{1}{2} \frac{\pi}{k} \right)^n \rightarrow R : \theta \mapsto P(\theta + x_i).$$

The proof is left as an exercise to the other author.

Use  $\psi$  from ?? and lemma 7 and  $\psi^{-1}$  from ?. The domain will eventually work itself out and leads to smooth transition mapping.

□

**Locus of position vector**

**Lemma 9.** For  $k > 0$ ,  $P$  is a  $(n+1)$ -sphere of radius  $k^{-1}$ .

*Proof of lemma 9.* The proof is left as an exercise to the other author.

Use ?? and et cetera.

□

**Lemma 10.** For  $k < 0$ ,  $P$  is a forward sheet of a two-sheeted  $(n+1)$ -hyperboloid of radius  $k^{-1}$ .

*Proof of lemma 10.* The proof is left as an exercise to the other author.

Use ?? and et cetera.

□

**Lemma 11.** For  $k \rightarrow 0$ ,  $P$  is a  $n$ -Euclidean manifold at infinity.

*Proof of lemma 11.* The proof is left as an exercise to the other author.

Use ?? and et cetera.

□

## Geometric properties

Construction of the metric  $d\ldots$

### Embedding

**Definition 21.** Let  $N = (Q, g)$  be a  $n$ -dimension Riemannian manifold on position parameter space with such inner product  $g$  that the map  $\cdot \mapsto \frac{1}{k} \cdot \times e^1 \in Q \rightarrow P$  is an isometric embedding to  $(n + 1)$ -Euclidean manifold.

**Lemma 12.** Position parameter  $\theta^i$  is associated to the following vector in position vector space.

$$\theta_i = \begin{bmatrix} -\operatorname{abs} k \tan_k(\theta^i) p^j \\ k \cot_k(\theta^i) p^{i+1} \\ 0 \end{bmatrix}$$

*Proof of lemma 12.* The proof is left as an exercise to the other author.

Use ?? to map from  $\theta$  to  $P$ .

$$\begin{aligned} \theta_i &= \frac{\partial p}{\partial \theta^i} \\ &= \begin{bmatrix} -\operatorname{abs} k \tan_k(\theta^i) p^j \\ k \cot_k(\theta^i) p^{i+1} \\ 0 \end{bmatrix} \end{aligned}$$

□

**Lemma 13.** The metric tensor of  $N$  is

$$g_{ij} = \begin{cases} (\dots) \prod_{a>i} \cos_k^2 \theta^a & \text{if } i = j, \\ 0 & \text{otherwise.} \end{cases}$$

*Proof of lemma 13.* The proof is left as an exercise to the other author.

Use lemma 8 to map from  $Q$  to  $\theta$ . Then use ?? to map from  $\theta$  to  $P$ . Then use definition 21 to find the inner product as multilinear function, result in the metric tensor.

$$\begin{aligned}
g_{ab} [\theta] &= \sum_{l,m=1}^{n+1} \frac{\partial p^l}{\partial \theta^i} g_{lm} [p] \frac{\partial p^m}{\partial \theta^j} \\
&= \sum_{l=1}^{n+1} \frac{\partial p^l}{\partial \theta^i} \frac{\partial p^l}{\partial \theta^j} \\
&= \theta_i \cdot \theta_j
\end{aligned}$$

$$g_{ab} = \begin{cases} g_{ba} & \text{if } a > b \\ \dots & \text{if } a < b \\ \dots & \text{if } a = b \end{cases}$$

If  $a < b$ ,

$$\begin{aligned}
g_{ab} &= \begin{bmatrix} -\text{abs } k \tan_k (\theta^a) p^j \\ k \cot_k (\theta^a) p^{a+1} \\ 0 \end{bmatrix} \cdot \begin{bmatrix} -\text{abs } k \tan_k (\theta^b) p^j \\ k \cot_k (\theta^b) p^{b+1} \\ 0 \end{bmatrix} \\
&= \sum k^2 \tan_k (\theta^a) \tan_k (\theta^b) p^{j^2} - \text{sgn } k k^2 \cot_k (\theta^a) \tan_k (\theta^b) p^{a+1^2} \\
&= \tan_k (\theta^b) \tan_k (\theta^a) \prod_{a \leq j \leq n+1} \cos_k^2 \theta^j \left( \prod_{1 \leq j < a} \cos_k^2 \theta^j + \sum \sin_k^2 \theta^i \prod_{i < j < a} \cos_k^2 \theta^j - \text{sgn } k \right) \\
&= \tan_k (\theta^b) \tan_k (\theta^a) \prod_{a \leq j \leq n+1} \cos_k^2 \theta^j \left( \prod_{1 \leq j < a} \cos_k^2 \theta^j + \text{sgn } k \left( 1 - \prod_{1 \leq j < a} \cos_k^2 \theta^j \right) - \text{sgn } k \right) \\
&= 0
\end{aligned}$$

If  $a = b$ ,

$$\begin{aligned}
g_{ab} &= \begin{bmatrix} -\text{abs } k \tan_k (\theta^a) p^j \\ k \cot_k (\theta^a) p^{a+1} \\ 0 \end{bmatrix} \cdot \begin{bmatrix} -\text{abs } k \tan_k (\theta^a) p^j \\ k \cot_k (\theta^a) p^{a+1} \\ 0 \end{bmatrix} \\
&= \sum (kp^j \tan_k \theta^a)^2 - (kp^{a+1} \cot_k \theta^a)^2 \\
&= \sin_k^2 (\theta^a) \prod_{a < j} \cos_k^2 \theta^j \left( \prod_{1 \leq j < a} \cos_k^2 \theta^j + \sum_{1 \leq i < a} \sin_k^2 \theta^i \prod_{i < j < a} \cos_k^2 \theta^j - \cot_k^2 (\theta^a) \right)
\end{aligned}$$

□

## Curvature

Proof of validity of the metric  $d\cdots$

### Curvature (Method I)

This method may be easier to generalize to Model II where each direction can have partially independent curvature (or even Model III where extrinsic curvature become a thing). But it may be challenging to define Gauss map properly.

**Lemma 14.** *Given a position parameter  $\theta$ , the tangent vector in position vector space can be calculated as follows*

$$\nu(\theta) = \begin{cases} \begin{bmatrix} kp^1 \\ +kp^i \\ 1 \\ 0 \end{bmatrix} & k > 0 \\ \frac{1}{\sqrt{-1+2(kp^1)^2}} \begin{bmatrix} kp^1 \\ -kp^i \end{bmatrix} & k < 0 \\ \begin{bmatrix} 1 \\ 0 \end{bmatrix} & k = 0 \end{cases}$$

*Proof of lemma 14.* The proof is left as an exercise to the other author.

Use lemma 9, lemma 10, lemma 10.

Nope, use exterior product and hedge operator instead. We'll then got

$$\begin{aligned} \nu &= \star \bigwedge \theta_i && \text{(need to be normalized)} \\ &= \begin{vmatrix} p_1 & p_2 & p_3 & \dots \\ \theta_1^1 & \theta_1^2 & \theta_1^3 & \dots \\ \theta_2^1 & \theta_2^2 & \theta_2^3 & \dots \\ \dots & \dots & \dots & \dots \end{vmatrix} \\ &= \begin{vmatrix} p_1 & p_2 & p_3 & \dots \\ -\text{abs } k \tan_k \theta^1 p^1 & k \cot_k \theta^1 p^2 & 0 & \dots \\ -\text{abs } k \tan_k \theta^2 p^1 & -\text{abs } k \tan_k \theta^2 p^2 & k \cot_k \theta^2 p^3 & \dots \\ \dots & \dots & \dots & \dots \end{vmatrix} \\ \nu^i &= (-1)^{i+1} \begin{vmatrix} -\text{abs } k \tan_k \theta^1 p^1 & k \cot_k \theta^1 p^2 & 0 & \dots \\ -\text{abs } k \tan_k \theta^2 p^1 & -\text{abs } k \tan_k \theta^2 p^2 & k \cot_k \theta^2 p^3 & \dots \\ \dots & \dots & \dots & \dots \end{vmatrix} && \text{(removed } p^i \text{ terms)} \end{aligned}$$

$$\nu^1 = k^n \prod \cot_k \theta^i p^{i+1}$$

$$\nu^2 = k^n \operatorname{sgn} k \tan_k \theta^1 p^2 \prod \cot_k \theta^i p^{i+1}$$

$\dots = \dots$

□

**Lemma 15.**

$$S_P(v) = v^i \begin{bmatrix} -\operatorname{sgn} k \tan_k(v^i) p^1 \\ -\tan_k(v^i) p^j \\ -\cot_k(v^i) p^j \operatorname{sgn} k \\ 0 \end{bmatrix}$$

*Proof of lemma 15.* The proof is left as an exercise to the other author.

$$S_P(v) = \nabla_v \nu(P)$$

$$\nabla_v f = v \cdot \frac{\partial f}{\partial x}$$

$$\frac{\partial \nu(P)}{\partial \theta^i} = \begin{bmatrix} -\operatorname{sgn} k \tan_k(\theta^i) p^1 \\ -\tan_k(\theta^i) p^j \\ -\cot_k(\theta^i) p^j \operatorname{sgn} k \\ 0 \end{bmatrix}$$

$$S_P(v) = v^i \begin{bmatrix} -\operatorname{sgn} k \tan_k(v^i) p^1 \\ -\tan_k(v^i) p^j \\ -\cot_k(v^i) p^j \operatorname{sgn} k \\ 0 \end{bmatrix}$$

false (need to map the derivative to tangent vector space at  $\theta$ )

□

**Lemma 16.**

$$II_P(v, w) = v^i w^i \begin{bmatrix} -\operatorname{sgn} k \tan_k(v^i) p^1 \\ -\tan_k(v^i) p^j \\ -\cot_k(v^i) p^j \operatorname{sgn} k \\ 0 \end{bmatrix}$$

*Proof of lemma 16.* The proof is left as an exercise to the other author.

$$\begin{aligned}\text{II}_P(v, w) &= S_{P(v)} \cdot w \\ &= v \cdot w \cdot \frac{\partial f}{\partial x} \\ &= v^i w^i \begin{bmatrix} -\operatorname{sgn} k \tan_k(v^i) p^1 \\ -\tan_k(v^i) p^j \\ -\cot_k(v^i) p^j \operatorname{sgn} k \\ 0 \end{bmatrix}\end{aligned}$$

false (effected)

□

### Lemma 17.

*Proof of lemma 17.* The proof is left as an exercise to the other author.

Eigenvector and Eigenvalue can be solved from the following matrix

$$\begin{bmatrix} -\operatorname{sgn} k \tan_k(\theta^i) p^1 \\ -\tan_k(\theta^i) p^j \\ -\cot_k(\theta^i) p^j \operatorname{sgn} k \\ 0 \end{bmatrix}$$

which is an upper triangular matrix.

Eigenvalue is then the diagonal element

$$\begin{aligned}&-\operatorname{sgn} k \tan_k(\theta^1) p^1 \\ &-\cot_k(\theta^i) p^i \operatorname{sgn} k \\ &-\cot_k(\theta^n)\end{aligned}$$

false (effected)

product of any 2 should be the value  $\kappa$ .

□

### Curvature (Method II)

This method may be easier to be done (despite the fact that it never finished).

But it raises problems when trying to generalize e.g. dealing with extrinsic curvature (which may be introduced in Model III if not to mess with other basis geometries).

**Lemma 18.**

**Lemma 19.**

### *Curvature (Conclusion)*

**Lemma 20.**

Trace back on why  $k$  is used all along instead of  $\kappa$ ...

**CurvatureParameter.** It can be seen that  $\sec(p) = \kappa = \text{sgn}(k)k^2$ . Hence, when provided  $\kappa$ ,  $k$  can be determined and used to evaluate the model.

### The Model

Merge all element back to the model...

**Definition 1.1.** For any parameter  $\kappa, n$ ,

$$\begin{aligned} M &:= M \\ \otimes_M &:= \cdot \\ \varphi_M &:= X \mapsto \theta \\ g_M &:= g \\ P_M &\equiv R \\ T_M &\equiv M \end{aligned}$$

for injective smooth function  $K : \kappa \mapsto k = \text{sgn } \kappa \sqrt{\text{abs } \kappa} \in \mathbb{R} \rightarrow \mathbb{R}$ .

**Assertion 1.1.**

**Assertion 1.2.**

### Future plan

### Model II

It is very simple to be able to model composite geometries e.g.  $S^2 \times E$  by tensor product of the existing model. But to be able to merge them as smooth model may be

challenging since not all combination of basis curvature have their own intrinsic geometry. So it may be to find independent variable for each basis or to introduce extrinsic curvature (Model A).

### Model B

It is known that  $E$  emerged at  $n \geq 1$  while  $S$  and  $H$  emerged at  $n \geq 2$  and there's more complex pure geometries than these that emerged in higher dimension. It is interesting and challenging to explore such geometries and prove whether the curvature still works as indicator in such geometries or are there any patterns for their symmetries.

### Model A

This model is based on curvature and mostly just 3 basis geometries and extrinsic curvature which seems to be interesting despite some critical result in some combination e.g.  $S^1 \times S^1$  vs  $S^2$ . It can be even more challenging to have variable curvature with respect to other intrinsic position.
